It would be especially desirable to ascertain the extent of such movement, and **how far the young fry are able to return, of their own volition,** to such localities as offer favourable condition; for their further growth.

FLUCTUATIONS IN THE GREAT FISHERIES OF NORTHERN EUROPE

It would be especially desirable to ascertain the extent of such movement, and **how far the young fry are able to return, of their own volition**, to such localities as offer favourable condition; for their further growth.

From very far!

Advection is (almost) **negligible** compared to swimming at the end of the larval stage

Key research perspectives

More species to examine **generality**

Mechanism for incredibly high speeds in larvae

Better understanding of **orientation** over large scales
