Notes on the function gsw_dynamic_enthalpy_CT_exact(SA,CT,p)

Young (2010) has defined dynamic enthalpy h^{\dagger} to be the difference between enthalpy and potential enthalpy, that is, $h - h^0 = h - c_p^0 \Theta$. Hence dynamic enthalpy h^{\dagger} is also equal to the following pressure integral of specific volume for a seawater parcel which does not exchange heat or salt as its pressure is changed during the integration,

$$\hat{h}^{\dagger}(S_{\mathrm{A}},\Theta,p) = h(S_{\mathrm{A}},\Theta,p) - c_{p}^{0}\Theta = \int_{P_{0}}^{P} \hat{v}(S_{\mathrm{A}},\Theta,p') dP', \qquad (1)$$

The lower limit of the integration is $P_0 \equiv 101\,325$ Pa and the pressure integral is done with pressure in Pa (not dbar). Enthalpy and dynamic enthalpy have units of J kg⁻¹.

This function, **gsw_dynamic_enthalpy_CT_exact**(SA,CT,p), evaluates dynamic enthalpy h^{\dagger} in terms of the input variables Absolute Salinity $S_{\rm A}$ Conservative Temperature Θ and pressure p. This function uses the full TEOS-10 Gibbs function $g(S_{\rm A}, t, p)$ of IOC *et al.* (2010), being the sum of the IAPWS-09 and IAPWS-08 Gibbs functions.

This function is essentially the following calls to two other GSW functions,

```
t = gsw_t_from_CT(SA,CT,p);
dynamic_enthalpy_CT_exact = gsw_enthalpy_t_exact(SA,t,p) - cp0*CT;
```
